

BRAC UNIVERSITY
Department of Computer Science and Engineering

Examination: Final

Semester: Fall 2024

Duration: 1 Hour 20 Minutes

Set - A

Full Marks: 40

CSE 420: Compiler Design

Figures in the right margin indicate marks.

Answer all the questions

COs	Questions	Marks														
C05	<div>1. Consider the following SDD. Draw the Annotated Parse Tree and Evaluate it for the String: $((a > b) \parallel (c > d)) \&\& ((w < x) \parallel (y < z))$</div> <div>Note: Here newLabel() method creates a label which is ‘L:’ with a subscript 1, 2, 3 and so on. For example, the first time the method is called it will create L₁:, next time it is called it will create L₂: and so on.</div> <table><tr><th>PRODUCTION</th><th>SEMANTIC RULES</th></tr><tr><td>$P \rightarrow (B)$</td><td>$B.true = newlabel()$ $B.false = newlabel()$ $P.code = B.code$</td></tr><tr><td>$B \rightarrow B_1 \parallel B_2$</td><td>$B_1.true = B.true$ $B_1.false = newlabel()$ $B_2.true = B.true$ $B_2.false = B.false$ $B.code = B_1.code \parallel label(B_1.false) \parallel B_2.code$</td></tr><tr><td>$B \rightarrow B_1 \&\& B_2$</td><td>$B_1.true = newlabel()$ $B_1.false = B.false$ $B_2.true = B.true$ $B_2.false = B.false$ $B.code = B_1.code \parallel label(B_1.true) \parallel B_2.code$</td></tr><tr><td>$B \rightarrow (B_1)$</td><td>$B_1.true = B.true$ $B_1.false = B.false$ $B.code = B_1.code$</td></tr><tr><td>$B \rightarrow E_1 \text{ rel } E_2$</td><td>$B.code = E_1.code \parallel E_2.code$ $\parallel gen('if' E_1.addr \text{ rel.op } E_2.addr 'goto' B.true)$ $\parallel gen('goto' B.false)$</td></tr><tr><td>$E \rightarrow id$</td><td>$E.addr = top.get(id.lexeme)$ $E.code = ''$</td></tr></table>	PRODUCTION	SEMANTIC RULES	$P \rightarrow (B)$	$B.true = newlabel()$ $B.false = newlabel()$ $P.code = B.code$	$B \rightarrow B_1 \parallel B_2$	$B_1.true = B.true$ $B_1.false = newlabel()$ $B_2.true = B.true$ $B_2.false = B.false$ $B.code = B_1.code \parallel label(B_1.false) \parallel B_2.code$	$B \rightarrow B_1 \&\& B_2$	$B_1.true = newlabel()$ $B_1.false = B.false$ $B_2.true = B.true$ $B_2.false = B.false$ $B.code = B_1.code \parallel label(B_1.true) \parallel B_2.code$	$B \rightarrow (B_1)$	$B_1.true = B.true$ $B_1.false = B.false$ $B.code = B_1.code$	$B \rightarrow E_1 \text{ rel } E_2$	$B.code = E_1.code \parallel E_2.code$ $\parallel gen('if' E_1.addr \text{ rel.op } E_2.addr 'goto' B.true)$ $\parallel gen('goto' B.false)$	$E \rightarrow id$	$E.addr = top.get(id.lexeme)$ $E.code = ''$	10
PRODUCTION	SEMANTIC RULES															
$P \rightarrow (B)$	$B.true = newlabel()$ $B.false = newlabel()$ $P.code = B.code$															
$B \rightarrow B_1 \parallel B_2$	$B_1.true = B.true$ $B_1.false = newlabel()$ $B_2.true = B.true$ $B_2.false = B.false$ $B.code = B_1.code \parallel label(B_1.false) \parallel B_2.code$															
$B \rightarrow B_1 \&\& B_2$	$B_1.true = newlabel()$ $B_1.false = B.false$ $B_2.true = B.true$ $B_2.false = B.false$ $B.code = B_1.code \parallel label(B_1.true) \parallel B_2.code$															
$B \rightarrow (B_1)$	$B_1.true = B.true$ $B_1.false = B.false$ $B.code = B_1.code$															
$B \rightarrow E_1 \text{ rel } E_2$	$B.code = E_1.code \parallel E_2.code$ $\parallel gen('if' E_1.addr \text{ rel.op } E_2.addr 'goto' B.true)$ $\parallel gen('goto' B.false)$															
$E \rightarrow id$	$E.addr = top.get(id.lexeme)$ $E.code = ''$															

2. Consider the following *SDT*. Draw the **Annotated Parse Tree** and **Evaluate** the values of the attributes **type** and **width** along with variable **offset** next to the appropriate non-terminal nodes for the following String:

int x; record {int a; float b;} y; float [5] [7] z;

Afterwards draw the memory diagram along with actual location and data

Note: Offsets are given in decimal. Memory location is also given in decimal. Every memory unit is of 1 byte. The width of int and float is also given in byte in the SDT. The variable `memory_addr` refers to the starting position of the memory address where the variables will be stored.

SDT:

$P \rightarrow \{ \text{offset} = 0; \text{memory_addr} = 58342; \} D$

$D \rightarrow T \text{ id } ; \{ \text{top.put(id.lexeme, T.type, offset); } D_1$
 $\text{offset} = \text{offset} + T.\text{width}; \}$

$D \rightarrow \epsilon$

$T \rightarrow \text{record '{' } \{ \text{Env.push(top); top = new Env(); } D \text{ '}' } \{ T.\text{type} = \text{record(top); } T.\text{width} = \text{offset};$
 $\text{Stack.push(offset); offset} = 0; \}$ $\text{top} = \text{Env.pop(); offset} = \text{Stack.pop();}$

$T \rightarrow B \{ t = B.\text{type}; w = B.\text{width}; \} C$ $\{ T.\text{type} = C.\text{type}; T.\text{width} = C.\text{width}; \}$

$B \rightarrow \text{int}$ $\{ B.\text{type} = \text{integer}; B.\text{width} = 3; \}$

$B \rightarrow \text{float}$ $\{ B.\text{type} = \text{float}; B.\text{width} = 7; \}$

$C \rightarrow \epsilon$ $\{ C.\text{type} = t; C.\text{width} = w; \}$

$C \rightarrow [\text{num}] C_1$ $\{ C.\text{type} = \text{array}(\text{num.value}, C_1.\text{type});$
 $C.\text{width} = \text{num.value} \times C_1.\text{width}; \}$

Example of Memory Diagram for String: `int v1; record {int y1; float y2;} v2;` where `memory_addr = 021871`; in the SDT.

C05	<p>3. Consider the following SDD. Draw the Annotated Parse Tree and Evaluate it for the String: while (a > b) a = c + d + e ;</p> <p>Note: Here new Temp() creates an instance of compiler generated temporary variables which is ‘t’ with a subscript 1, 2, 3 and so on. For example, the first time an instance is created it will create t₁, next time it is called it will create t₂ and so on. Furthermore, the newLabel() method creates a label which is ‘L:’ with a subscript that follows similar logic as the temporary variable, for example, L₁:, L₂: and so on. If the newLabel() method is assigned to a variable like begin = newLabel(), it will name the label as the assigned variable like “begin:”</p> <table> <tr> <th>PRODUCTION</th><th>SEMANTIC RULES</th></tr> <tr> <td>$P \rightarrow S$</td><td> $S.next = newlabel()$ $P.code = S.code \parallel label(S.next)$ </td></tr> <tr> <td>$S \rightarrow id = E ;$</td><td> $S.code = E.code \parallel$ $gen(top.get(id.lexeme) '=' E.addr)$ </td></tr> <tr> <td>$S \rightarrow \text{while} (B) S_1$</td><td> $begin = newlabel()$ $B.true = newlabel()$ $B.false = S.next$ $S_1.next = begin$ $S.code = label(begin) \parallel B.code$ $\parallel label(B.true) \parallel S_1.code$ $\parallel gen('goto' begin)$ </td></tr> <tr> <td>$B \rightarrow E_1 \text{ rel } E_2$</td><td> $B.code = E_1.code \parallel E_2.code$ $\parallel gen('if' E_1.addr \text{ rel.op } E_2.addr 'goto' B.true)$ $\parallel gen('goto' B.false)$ </td></tr> <tr> <td>$E \rightarrow E_1 + E_2$</td><td> $E.addr = \text{new Temp}()$ $E.code = E_1.code \parallel E_2.code \parallel$ $gen(E.addr '=' E_1.addr '+' E_2.addr)$ </td></tr> <tr> <td>$\mid id$</td><td> $E.addr = top.get(id.lexeme)$ $E.code = ''$ </td></tr> </table>	PRODUCTION	SEMANTIC RULES	$P \rightarrow S$	$S.next = newlabel()$ $P.code = S.code \parallel label(S.next)$	$S \rightarrow id = E ;$	$S.code = E.code \parallel$ $gen(top.get(id.lexeme) '=' E.addr)$	$S \rightarrow \text{while} (B) S_1$	$begin = newlabel()$ $B.true = newlabel()$ $B.false = S.next$ $S_1.next = begin$ $S.code = label(begin) \parallel B.code$ $\parallel label(B.true) \parallel S_1.code$ $\parallel gen('goto' begin)$	$B \rightarrow E_1 \text{ rel } E_2$	$B.code = E_1.code \parallel E_2.code$ $\parallel gen('if' E_1.addr \text{ rel.op } E_2.addr 'goto' B.true)$ $\parallel gen('goto' B.false)$	$E \rightarrow E_1 + E_2$	$E.addr = \text{new Temp}()$ $E.code = E_1.code \parallel E_2.code \parallel$ $gen(E.addr '=' E_1.addr '+' E_2.addr)$	$\mid id$	$E.addr = top.get(id.lexeme)$ $E.code = ''$	10
PRODUCTION	SEMANTIC RULES
